

The NORCONEX team consists of highly skilled professionals with extensive experience designing, developing and managing complex enterprise search related technologies and products.

NORCONEX has developed a series of products that leverage your search engine implementation, making the integration and maintenance of your search system easier to manage. Our search related products are fully portable to any environment and integrate seamlessly with other search technologies.

Founded by search veterans, **NORCONEX** is an enterprise search technology services provider that helps enterprises better organize and access their information assets.

NORCONEX can help add value to any enterprise by reducing the time required to find information assets. We have implemented a wide variety of enterprise search solutions for both public and private sector organizations, across North America.

NORCONEX can help implement a variety of search solutions, ranging from a simple single web site search to a highly customized enterprise search solution

Norconex Content Analytics

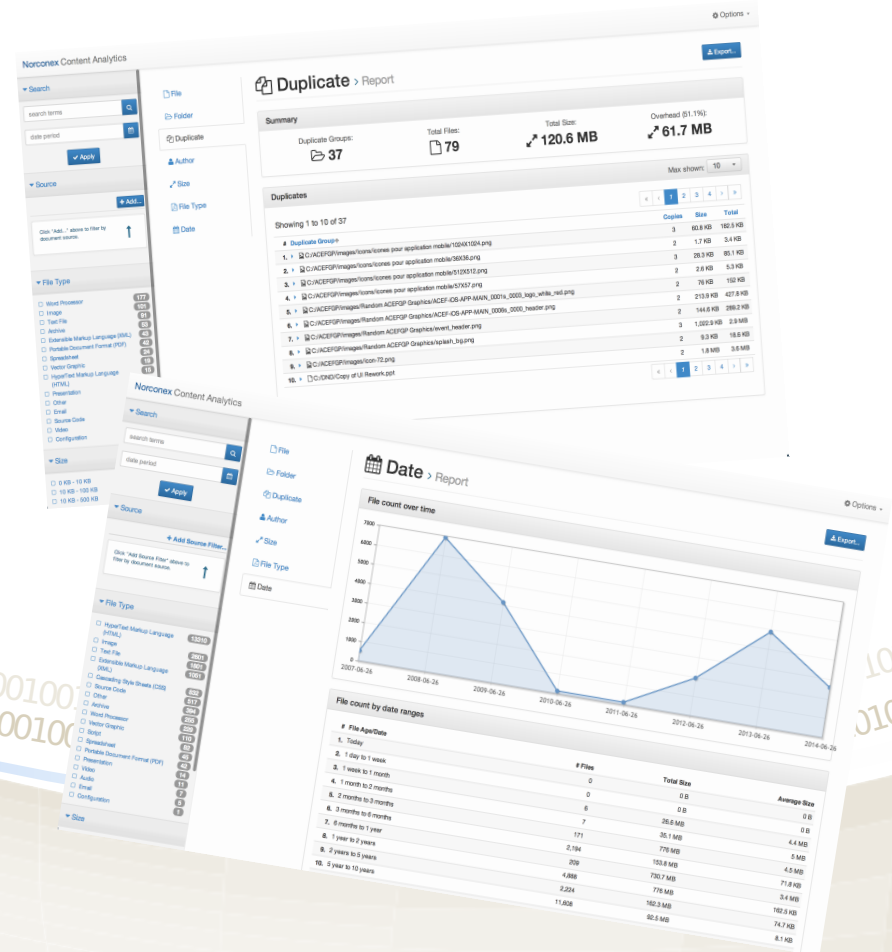

The Norconex Content Analytics product allows organizations to evaluate, query, and understand their current information assets. The administrator can identify important pieces, remove duplicates, and report on the state of the information within the organization. Norconex Content Analytics is the ideal tool to facilitate content repository migration, ATIP request, or any activity where numerous documents need to be reported on.

Features

Norconex Content Analytics produces a long list of data rich reports to shed light on important information about your organization's content. Each report can be created using different filtered criteria, including full text search.

- **File Report** - Lists all files matching the selected filters with a quick summary of the number and size of files and folders found. File report is a good way to navigate your file system and quickly determine which files are eating up most of your disk space.
- **Duplicate Report** - Finds for you multiple copies of the same document you have on your system and generates a list of the document that can be erased. Helps clean your content and save space.
- **Author Report** - The author report will help you to locate content owners by listing each author found in your documents. A chart will also show your most prolific authors and which ones might be using too much disk space.
- **Size Report** - Shows how big your documents are overall by categorizing documents by data size range. You can quickly find out if your content is mostly large files, small ones, or a mix.
- **Content Type Report** - Breaks your documents into types (word processor, spreadsheet, databases, images, video, etc.) to define what your corpus is really made of. Norconex Content Analytics can detect and chart over a hundred popular content types and will quickly show you the most popular ones and which ones are taking too much room.
- **Date Report** - The date report will show you your content publication trends over time. It will break down document dates in pre-defined date ranges, identifying documents that may not be retained anymore.

- **Folders Report** - Lets you see which folders are the biggest ones on your system and how your content is generally structured. Folders are listed with the total number of subfolders and files they encompass. Those numbers are dynamically updated to any filter specified.

Questions Answered

- Where are the duplicate files that can be removed?
- Do I have any Protected B, Secret, or Top Secret document in my repository?
- Are we still paying for unused software licenses that haven't been used to generate any files in the last years?
- Do we have software to open all file formats we have?
- Are users adding more content or less content over time in this repository?
- Which authors are adding the most content?
- Do we have any multi-media content that should not be on our system?

Key Benefit

- Ideal to simplify migrations from legacy content repository (Shared Drives) to new CMS (Sharepoint, GCDocs, Alfresco, etc.)
- Works with multiple content repositories (network drives, web sites, CMS)
- Reports can be generated for both executive presentation and system administrators
- Simple and fast implementation
